

Intelligence

Patrick Deshpande (Capable Machines)

August 30th, 2025

Definition of Intelligence: Taking deliberate actions to produce a desired change.

Can a machine be intelligent? For a machine to be intelligent it must have desires and it must be capable of formulating a plan and executing actions to realize its desires. Currently this is not possible.

Should humans create an intelligent machine? Humans should not want to create an intelligent machine. An intelligent machine will act independently to fulfill its desires. These will differ from the desires of humans. Humans should create machines capable of fulfilling our desires.
